

DAC1401D125

Dual 14-bit DAC, up to 125 Msps

Rev. 03 — 2 July 2012

Product data sheet

1. General description

The DAC1401D125 is a dual port, high-speed, 2-channel CMOS Digital-to-Analog Converter (DAC), optimized for high dynamic performance with low power dissipation. Supporting an update rate of up to 125 Msps, the DAC1401D125 is suitable for Direct IF applications.

Separate write inputs allow data to be written to the two DAC ports independently of one another. Two separate clocks control the update rate of each DAC port.

The DAC1401D125 can interface two separate data ports or one single interleaved high-speed data port. In Interleaved mode, the input data stream is demultiplexed into its original I and Q data and latched. The I and Q data is then converted by the two DACs and updated at half the input data rate.

Each DAC port has a high-impedance differential current output, suitable for both single-ended and differential analog output configurations.

The DAC1401D125 is pin compatible with the AD9767, DAC2904 and DAC5672.

2. Features and benefits

- Dual 14-bit resolution
- 125 Msps update rate
- Single 3.3 V supply
- Dual-port or Interleaved data modes
- 1.8 V, 3.3 V and 5 V compatible digital inputs
- Internal and external reference
- 2 mA to 20 mA full-scale output current
- Typical 185 mW power dissipation
- 16 mW power-down
- SFDR: 81 dBc; $f_o = 1$ MHz; $f_s = 52$ Msps
- SFDR: 79 dBc; $f_o = 10.4$ MHz; $f_s = 78$ Msps
- SFDR: 75 dBc; $f_o = 1$ MHz; $f_s = 52$ Msps; -12 dBFS
- LQFP48 package
- Industrial temperature range of -40 °C to $+85$ °C

3. Applications

- Quadrature modulation
- Medical/test instrumentation
- Direct IF applications
- Direct digital frequency synthesis
- Arbitrary waveform generator

10. Application information

10.1 General description

The DAC1401D125 is a dual 14-bit DAC operating up to 125 Msps. Each DAC consists of a segmented architecture, comprising a 7-bit thermometer sub-DAC and a 7-bit binary weighted sub-DAC.

Two modes are available for the digital input depending on the status of the pin MODE. In Dual port mode, each DAC uses its own data input line at the same frequency as the update rate. In Interleaved mode, both DACs use the same data input line at twice the update rate.

Each DAC generates on pins IOUTAP/IOUTAN and IOUTBP/IOUTBN two complementary current outputs. This provides a full-scale output current ($I_{O(fs)}$), up to 20 mA. A single common or two independent full-scale current controls can be selected for both channels using pin GAINCTRL. An internal reference is available for the reference current which is externally adjustable using pin REFIO.

The DAC1401D125 operates at 3.3 V and has separate digital and analog power supplies. Pin PWD is used to power-down the device. The digital input is 1.8 V compliant, 3.3 V compliant and 5 V tolerant.

10.2 Input data

The DAC1401D125 input follows a straight binary coding where DA13 and DB13 are the Most Significant Bits (MSB) and DA0 and DB0 are the Least Significant Bits (LSB).

The setting applied to pin MODE defines whether the DAC1401D125 operates in Dual port mode or in Interleaved mode (see Table 6).

Table 6. Mode selection

Mode	Function	DA13 to DA0	DB13 to DB0	Pin 17	Pin 18	Pin 19	Pin 20
0	Interleaved mode	active	off	IQWRT	IQCLK	IQRESET	IQSEL
1	Dual port mode	active	active	WRTA	CLKA	CLKB	WRTB

10.2.1 Dual port mode

The data and clock circuit for Dual port mode operation is shown in Figure 14.

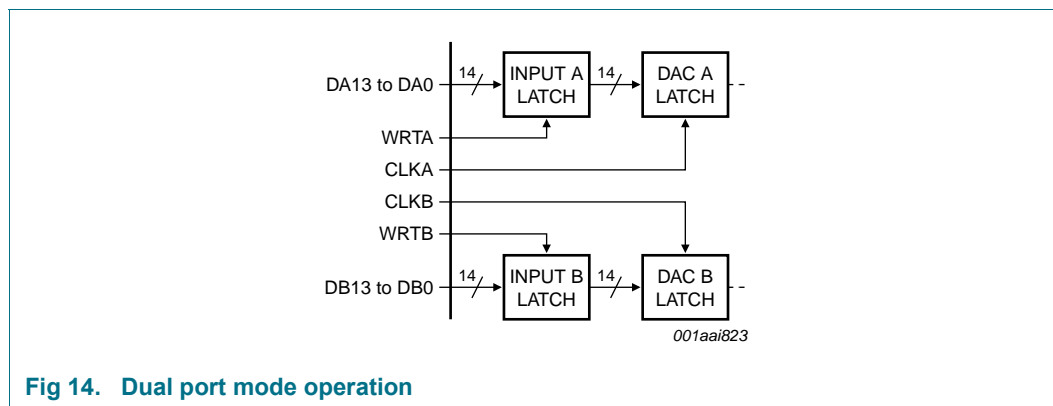

Fig 14. Dual port mode operation

Each DAC has its own independent data and clock inputs. The data enters the input latch on the rising edge of the WRTA/WRTB signal and is transferred to the DAC latch. The output is updated on the rising edge of the CLKA/CLKB signal.

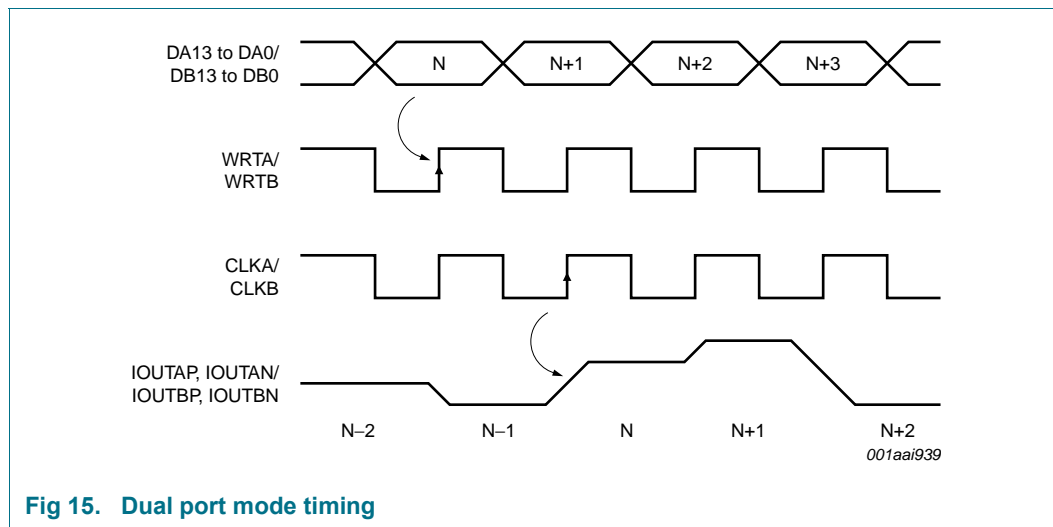

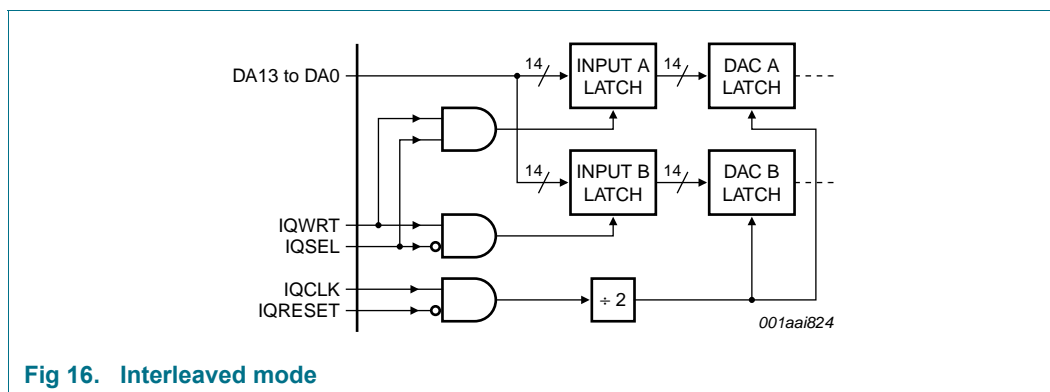

Fig 15. Dual port mode timing

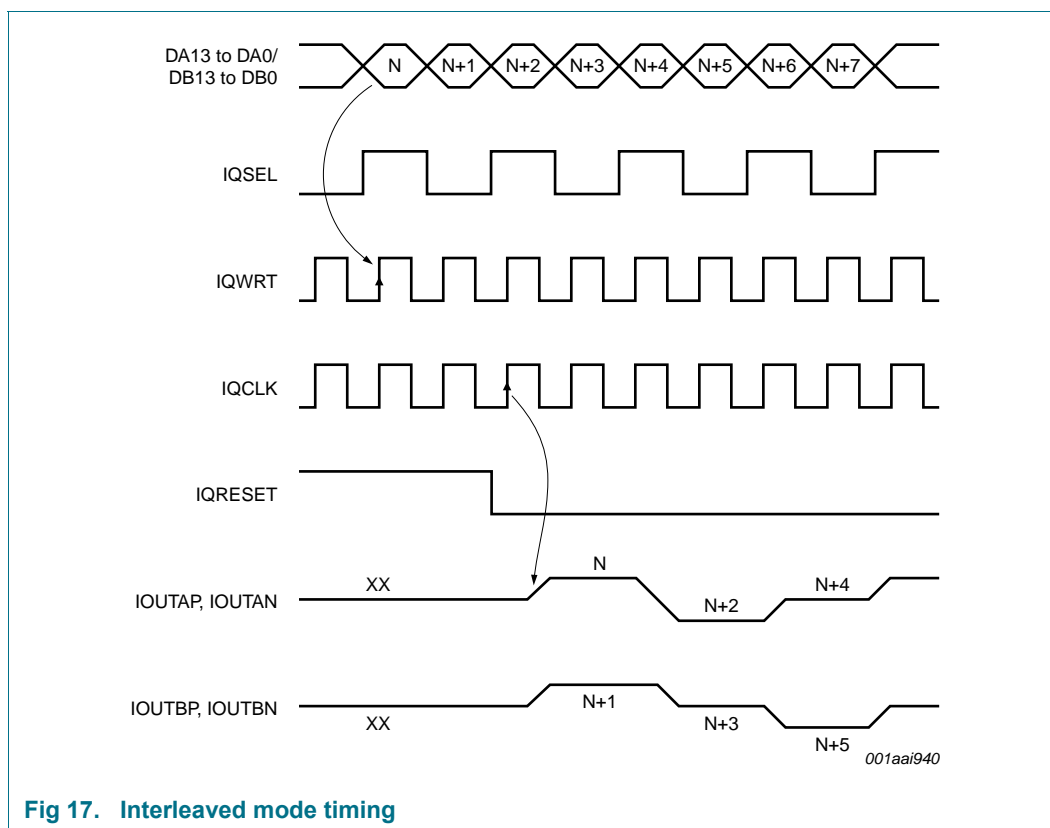

10.2.2 Interleaved mode

The data and clock circuit for Interleaved mode operation is illustrated in Figure 16.

In Interleaved mode, both DACs use the same data and clock inputs at twice the update rate. Data enters the latch on the rising edge of IQWRT. The data is sent to either latch A or latch B, depending on the value of IQSEL. The IQSEL transition must occur when IQWRT and IQCLK are LOW.

The IQCLK is divided by 2 internally and the data is transferred to the DAC latch. It is updated on its rising edge. When IQRESET is HIGH, IQCLK is disabled, see Figure 17.

10.3 Timing

The DAC1401D125 can operate at an update rate up to 125 Msps. This generates an input data rate of 125 MHz in Dual port mode and 250 MHz in Interleaved mode. The timing of the DAC1401D125 is shown in Figure 18.

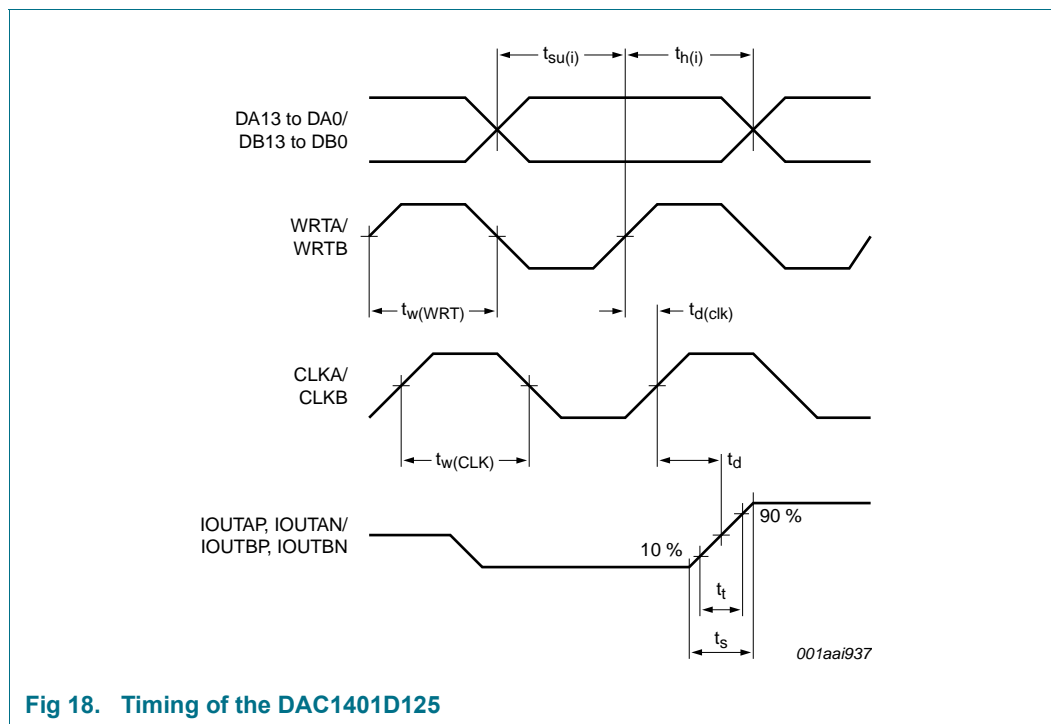

Fig 18. Timing of the DAC1401D125

The typical performances are measured at 50 % duty cycle but any timing within the limits of the characteristics will not alter the performance.

- A configuration resulting in the same timing for the signals WRTA/WRTB and CLKA/CLKB, can be achieved either by synchronizing them or by connecting them together.
- The rising edge of the CLKA/CLKB signal can also be placed in a range from half a period in front of the rising edge of the WRTA/WRTB signal to half a period minus 1 ns after the rising edge of the WRTA/WRTB signal.

A typical set-up time of 0 ns and a hold time of 0.6 ns enable the DAC1405D125 to be easily integrated into any application.

10.4 DAC transfer function

The full-scale output current for each DAC is the sum of the two complementary current outputs:

$$I_{O(fs)} = I_{IOUTP} + I_{IOUTN} \quad (1)$$

The output current depends on the digital input data:

$$I_{IOUTP} = I_{O(fs)} \times \left(\frac{DATA}{16384} \right) \quad I_{IOUTN} = I_{O(fs)} \times \left(\frac{(16383 - DATA)}{16384} \right)$$

Table 7 shows the output current as a function of the input data, when $I_{O(fs)} = 20$ mA.

Table 7. DAC transfer function

Data	DA13/DB13 to DA0/DB0	IOUTAP/IOUTBP	IOUTAN/IOUTBN
0	00 0000 0000 0000	0 mA	20 mA
...
8192	10 0000 0000 0000	10 mA	10 mA
...
16383	11 1111 1111 1111	20 mA	0 mA

10.5 Full-scale current adjustment

The DAC1401D125 integrates one 1.25 V reference and two current sources to adjust the full-scale current in both DACs.

The internal reference configuration is shown in Figure 19.

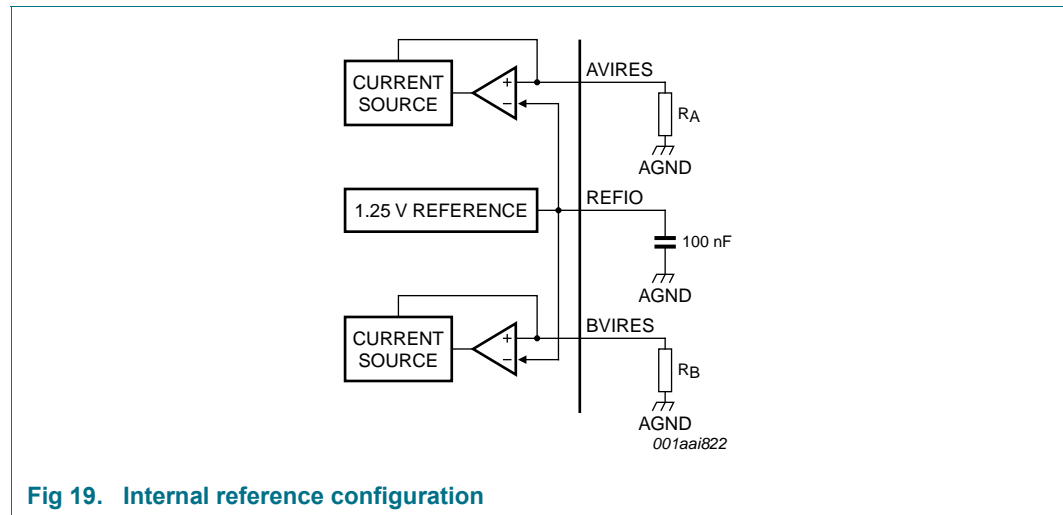

Fig 19. Internal reference configuration

The bias current is generated by the output of the internal regulator connected to the inverting input of the internal operational amplifiers. The external resistors R_A and R_B are connected to pins AVIRES and BVIRES, respectively. This configuration is optimal for temperature drift compensation because the bandgap can be matched with the voltage on the feedback resistors.

The relationship between full-scale output current ($I_{O(fs)}$) at the output of channel A or channel B and the resistor is:

$$I_{O(fs)} = \frac{24V_{REFIO}}{R_A} \quad (2)$$

The output current of the two DACs is typically fixed at 20 mA when both resistors R_A and R_B are set to 1.5 k Ω . The operational range of DAC1401D125 is from 2 mA to 20 mA.

It is recommended to decouple pin REFIO using a 100 nF capacitor.

An external reference can also be used for applications requiring higher accuracy or precise current adjustment. Due to the high input impedance of pin REFIO, applying an external source disables the bandgap.

10.6 Gain control

Table 8 shows how to select the different gain control modes.

Table 8. Gain control

GAINCTRL	Mode	DAC A full-scale control	DAC B full-scale control
0	independent gain control	AVIRES	BVIRES
1	common gain control	AVIRES	AVIRES

In Independent gain mode, both full-scale currents can be adjusted independently using resistors R_A on pin AVIRES and R_B on pin BVIRES.

In Common gain mode, the full-scale current is adjusted with resistor R_A on pin AVIRES and divided by two in both DACs.

10.7 Analog outputs

See Figure 20 for the analog output circuit of one DAC. This circuit consists of a parallel combination of PMOS current sources and associated switches for each segment.

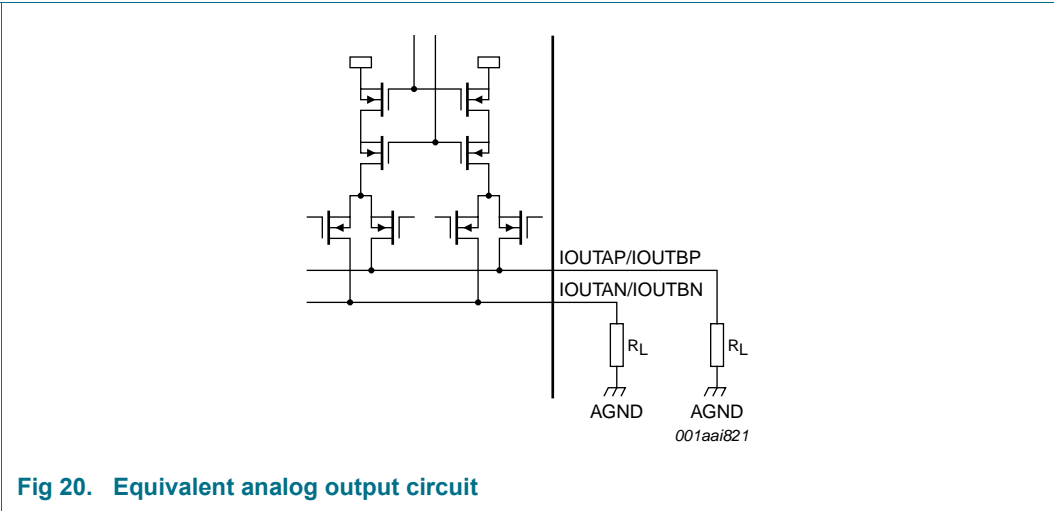

Fig 20. Equivalent analog output circuit

Cascode source configuration enables the output impedance of the source to be increased, thus improving the dynamic performance by reducing distortion.

The DAC1401D125 can be used either with:

- a differential output, coupled to a transformer (or operational amplifier) to reduce even-order harmonics and noise
- or a single-ended output for applications requiring unipolar voltage.

The typical configuration is to use 1 V p-p level on each output IOUTAP/IOUTBP and IOUTAN/IOUTBN but several combinations can be used as far as they respect the voltage compliance range.

10.7.1 Differential output using transformer

The use of a differentially coupled transformer output (see Figure 21) provides optimum distortion performance. In addition, it helps to match the impedance and provides electrical isolation.

Fig 21. Differential output with transformer

The center tap is grounded to allow the DC current flow to/from both outputs. If the center tap is open, the differential resistor must be replaced by two resistors connected to ground.

10.7.2 Single-ended output

Using a single load resistor on one current output will provide an unipolar output range, typically from 0 V to 0.5 V with a 20 mA full-scale current at a 50 Ω load.

Fig 22. Single-ended output

The resistor on the other current output is 25 Ω .

10.8 Power-down function

The DAC1404D125 has a power-down function to reduce the power consumption when it is not active.

Table 9. Power-down

PWD	Device function	Power dissipation (typ)
0	active	185 mW
1	not active	16.5 mW

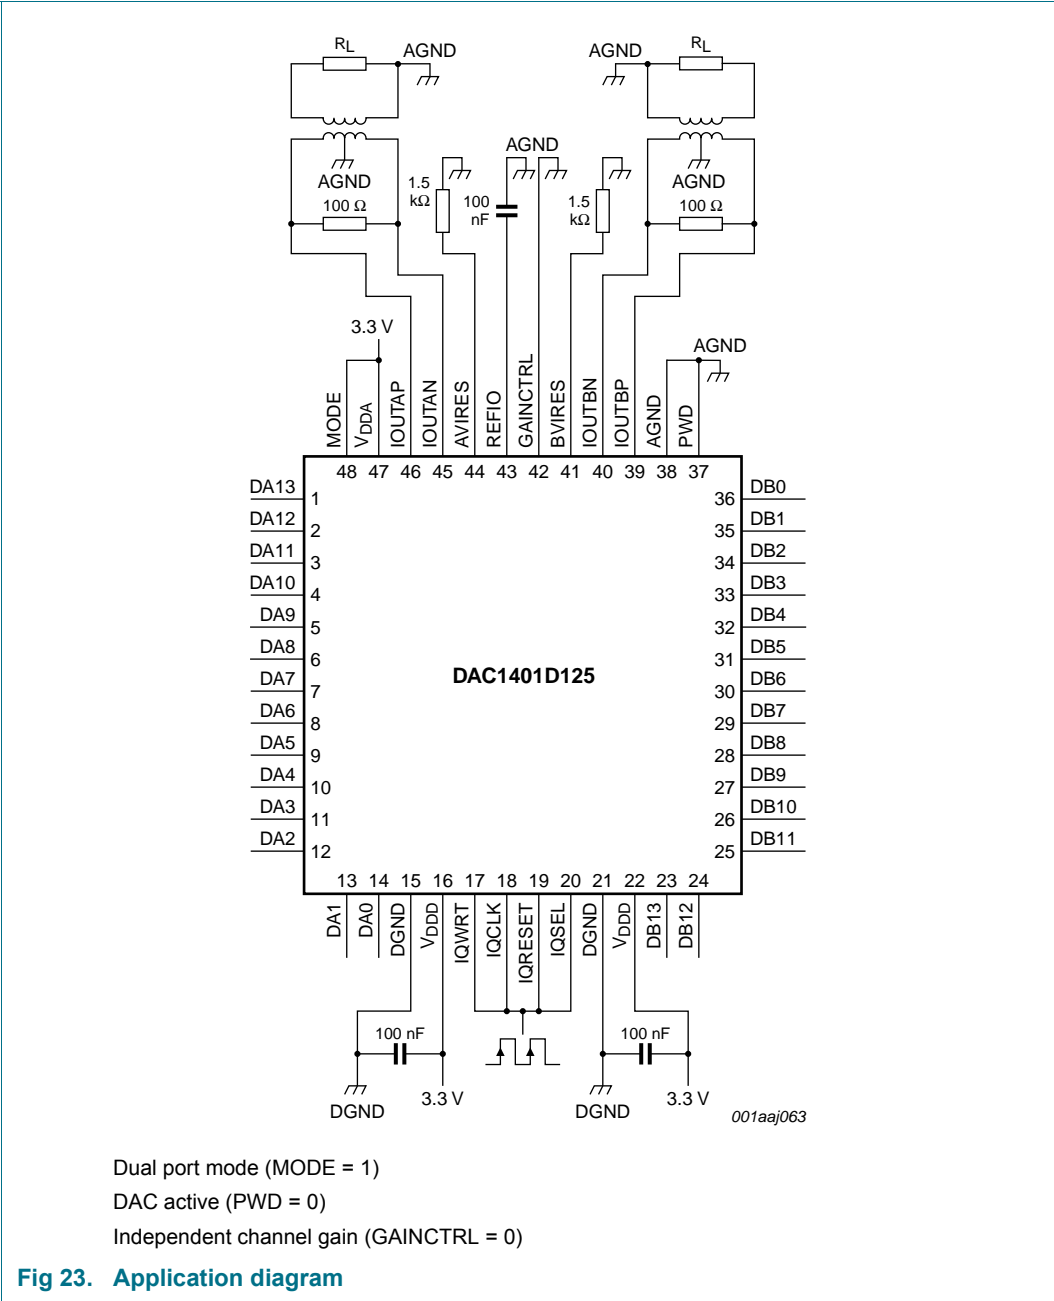

10.9 Alternative parts

The following alternative parts are also available.
